MISTECH

Summary

MiSTech is a disaster education platform developed in collaboration with students from the Faculty of Teacher Training and Education (FKIP), Universitas Riau, majoring in Primary School Teacher Education, to develop an interactive learning medium for elementary school students to learn disaster mitigation through a mobile application, supported by a web-based management dashboard.

Contribution & Impact

Developed the Flutter mobile app and backend system, integrating the API, database, and dashboard to manage disaster education materials and quizzes.

What I Learned

This project taught me how to build a complete application beyond the user interface. I learned how mobile applications communicate with backend services, how to structure CRUD operations and databases, and how different components of a software system need to work together to create a usable product.

INTELVIEW

Summary

INTELVIEW is an AI-powered interview assessment system designed to analyze interview sessions and provide structured evaluation through speech, visual, and language analysis.

Contribution & Impact

I contributed to the development of the AI analysis pipeline, including speech-to-text processing, AI-based interview analysis, and visual analysis of interview sessions. The system combines technologies such as Whisper, Gemini, OpenCV, MediaPipe, and YOLO to analyze different aspects of an interview and generate assessment results, scores, and feedback.

What I Learned

I learned how different AI technologies can be combined into a single end-to-end application. More importantly, I learned that building an AI product is not only about training a model, but also about designing a reliable pipeline, connecting multiple AI components, processing different types of data, and delivering understandable results to users.

Corseo

Summary

Corseo is an AI-powered recommendation system that helps users discover relevant courses, job opportunities, and discussion forums based on their interests, skills, and learning goals.

Contribution & Impact

Developed the AI recommendation system using a hybrid Neural Collaborative Filtering and Content-Based Filtering approach with TensorFlow, TF-IDF, and dimensionality reduction to provide more relevant course, job, and forum recommendations.

What I Learned

This project helped me understand that recommendation systems require more than simply training a machine learning model. I learned how to combine different recommendation approaches, process categorical and textual data, evaluate ranking performance, and structure a machine learning pipeline that can be integrated into a larger application.

SMART E-PPM

Summary

Smart E-PPM is a chatbot developed in collaboration with the Research and Community Service Institute (LPPM) of Universitas Riau and used to help users access E-PPM information, announcements, and guidance through a conversational interface supported by Retrieval-Augmented Generation.

Contribution & Impact

I contributed to building and developing the chatbot's Retrieval-Augmented Generation (RAG) pipeline, including the information retrieval process and integration with the language model. This enables the chatbot to retrieve relevant information from E-PPM knowledge sources before generating responses.

What I Learned

I learned how to integrate Large Language Models with external knowledge sources through document processing, embeddings, retrieval, and the RAG pipeline to provide grounded and context-relevant responses.

Project Type

MLOps Obesity Classification

Summary

This project explores an end-to-end machine learning workflow for obesity classification, from model experimentation and optimization to deployment and monitoring.

Contribution & Impact

I developed and optimized a Random Forest classification model using GridSearch to explore different hyperparameter combinations. I then built and deployed the trained model as a containerized service using Docker and implemented model monitoring with Prometheus and Grafana.

What I Learned

I learned that developing a machine learning model is only one part of building a machine learning system. This project introduced me to experiment tracking, model optimization, containerization, model serving, and monitoring. It helped me understand how machine learning models can be maintained and observed after deployment.
